PART I INTRODUCTION	1
1 The Evolution of Financial Analysis	3
1.1 Bookkeeping	3
1.2 Modern finance	8
1.3 Departments, silos and analysis	10
1.4 The IT system landscape	11
1.5 New approach	15
1.6 Hazards of a single solution	17
2 Finding the Elements	19
2.1 The notion of elements	19
2.1.1 Elements and science	19
2.1.2 Analyzing analysis	21
2.2 Elements of financial analysis	21
2.2.1 Liquidity	22
2.2.2 Value and income	22
2.2.3 Risk and sensitivity analysis	23
2.3 Input elements	25
2.4 Financial events and expected cash flows	26
2.5 Risk factors and risk categories	29
2.6 The time dimension	31
2.6.1 Time and the calendar time	31
2.6.2 The role of intervals	32
2.6.3 Double existence of time	32

2.7	Classification of analysis	33
2.7.1	Liquidation and going-concern view	33
2.7.2	Analysis types	35
2.8	Nonfinancial cash flows	37
2.9	The methodology as an image	39
PART II	INPUT ELEMENTS	41
3	Financial Contracts	43
3.1	Modeling of financial contracts	43
3.2	Standard contract types	46
3.3	Rules and mechanisms of standard contracts	51
3.3.1	Principal amortization patterns	51
3.3.2	Principal draw-down patterns (step-up)	53
3.3.3	Interest payment patterns	54
3.3.4	Fixed/variable (rate adjustments)	55
3.3.5	FX rates	57
3.3.6	Stock patterns	57
3.3.7	Commodity patterns	58
3.3.8	Plain vanilla option patterns	58
3.3.9	Exotic option patterns	59
3.3.10	Credit risk	60
3.3.11	Behavioral patterns	61
3.4	Examples	62
3.4.1	Principal at maturity (PAM)	62
3.4.2	Annuities (ANN)	63
3.4.3	Regular amortizer (RGM)	64
3.4.4	Interest rate swap (IRSWP)	65
3.4.5	Forward rate agreement (FRA)	66
3.4.6	Bond and interest rate options (IROPT)	67
3.5	Nonstandard contract types	68
3.5.1	Input elements and events	69
3.5.2	Analysis elements	70
	Appendix: Practical considerations	70
3.A.1	Mapping process	71
3.A.2	Data quality	71
4	Market Risk Factors	73
4.1	Expectations	74
4.1.1	Economic expectations	74
4.1.2	Arbitrage-free markets and risk-neutral valuation	75
4.1.3	Absence of arbitrage and economic expectation	79
4.1.4	Linear and nonlinear effects	80
4.2	Static modeling	81
4.2.1	Interest rates	81
4.2.2	Stocks, exchange rates and commodities	84
4.2.3	Spreads as risk factors	85

	Contents	vii
4.3 Stochastic market models: the arbitrage-free world		87
4.3.1 Stock price models		87
4.3.2 Beyond geometric Brownian motion		90
4.3.3 Interest rates: general considerations		91
4.3.4 Short rate models		92
4.3.5 Forward rate models		93
4.4 Stochastic market models: the real world		96
4.4.1 Economic scenario generation		97
4.4.2 Modeling individual products: stocks and commodities		98
4.4.3 Product rates		100
4.5 Alternative valuation techniques		101
4.5.1 Arbitrage-free and complete markets		102
4.5.2 Arbitrage-free incomplete markets		103
4.5.3 Discounting with deflators		105
4.5.4 Arbitrage opportunities and deflators		107
Further reading		108
5 Counterparty		111
5.1 Exposure, rating and probabilities of default		111
5.2 Data determining gross exposure		113
5.2.1 Counterparty descriptive data		113
5.2.2 Counterparty hierarchies and group structures		114
5.2.3 Counterparty and financial contracts		115
5.3 Credit enhancements		115
5.3.1 Credit enhancements and financial contracts		116
5.3.2 Guarantees		118
5.3.3 Credit derivatives		120
5.3.4 Collaterals		124
5.3.5 Close-out netting agreement		125
5.3.6 Double default		126
5.4 Credit line and limits		127
5.4.1 Credit lines		127
5.4.2 Credit line exposure		128
5.4.3 Credit limits		130
5.5 Credit ratings		131
5.5.1 Measurement of credit rating		131
5.5.2 Classifying credit ratings		132
5.5.3 Ratings classes and exposures		132
5.5.4 Rating techniques		134
Further reading		134
6 Behavior		135
6.1 Risk sources and behavior		136
6.2 Market-related behavior		138
6.2.1 Replication		138
6.2.2 Prepayment		143

viii	Contents	
	6.2.3 Sales	145
	6.2.4 Draw-down	146
6.3	Insurance-related behavior	148
	6.3.1 Mortality, longevity and invalidity	148
	6.3.2 Surrender/lapse	149
	6.3.3 Annuity conversion	150
6.4	Credit risk-related behavior	151
	6.4.1 Migration and probability of default	151
	6.4.2 Recovery	152
	6.4.3 Used at default	153
6.5	Sequence of behavioral effects	154
	Further reading	155
7	Costs	157
	7.1 Introduction to cost accounting	157
	7.1.1 Fixed and variable costs	158
	7.1.2 Standard cost accounting	159
	7.1.3 Activity-based cost accounting	161
	7.1.4 Examples of cost allocation	162
	7.2 Allocating costs to financial contracts	164
	7.2.1 Cost, contracts and counterparties	164
	7.2.2 Cost patterns in the financial service sector	166
	7.3 Integration of costs into the general framework	166
	7.3.1 Costs as a financial event	167
	7.3.2 Dealing with costs in different temporal modes	168
	7.3.3 Costs and risk	169
	7.4 Summary and conclusions	171
	Further reading	172
PART III	ANALYSIS – LIQUIDATION VIEW	173
8	Financial Events and Liquidity	175
	8.1 Financial event processing	176
	8.2 Examples	178
	8.2.1 Fixed rate instruments	178
	8.2.2 Variable rate instruments	180
	8.2.3 Swaps	182
	8.2.4 Forward rate agreements	183
	8.3 Behavioral events	183
	8.4 Liquidity reports	186
	8.4.1 Cash management	186
	8.4.2 Liquidity gap	186
	Further reading	190

9 Value, Income and FTP	191
9.1 Valuation principles	191
9.1.1 Value and income	192
9.1.2 Overview of valuation principles	194
9.1.3 Parallel valuation techniques and balance sheets	195
9.2 The big four	197
9.2.1 Nominal value	197
9.2.2 Amortized cost	198
9.2.3 Historic/write-off at end	199
9.2.4 Mark-to-market/fair value	200
9.3 Other valuation principles	202
9.3.1 Linear write-off	202
9.3.2 Lower of cost or market	202
9.3.3 Minimal value	203
9.4 Special cases	203
9.4.1 Multicurrency	204
9.4.2 Credit-related impairment	205
9.4.3 Operational considerations	206
9.5 IFRS 32, 39	207
9.6 Funds transfer pricing	210
9.6.1 The problem	210
9.6.2 The accrual method	213
9.6.3 The NPV method	215
9.6.4 Nonmaturity contracts	216
Further reading	218
10 Sensitivity	219
10.1 Challenges of sensitivity calculation	219
10.2 Interest rate sensitivities from events	221
10.3 Other market sensitivities	225
10.4 Behavioral sensitivities	226
10.4.1 Credit default sensitivity	226
10.4.2 Mortality sensitivity	230
10.5 Sensitivity reports	231
10.5.1 Interest sensitivity gap	231
10.5.2 Duration and key rate duration	234
10.5.3 Other market sensitivity reports	235
10.5.4 Credit exposure	236
10.5.5 Limits	237
11 Risk	241
11.1 Risk and VaR	241
11.1.1 Risk	241
11.1.2 VaR	243

11.2	Analytical VaR methods	244
11.2.1	Market risk	244
11.2.2	CreditRisk+	246
11.2.3	Insurance risk	250
11.2.4	Combining risks	252
11.3	Numerical VaR methods	253
11.3.1	Market risk	253
11.3.2	Credit risk	254
11.3.3	Insurance risk	258
11.3.4	Liquidity risk and earning at risk	258
11.4	Expected shortfall	259
11.5	Stress and shock scenarios	260
11.6	Regulatory risk measures	262
11.7	Backtesting	263
11.7.1	Type I and type II errors	263
11.7.2	Market risk: VaR model backtesting	264
11.7.3	Credit risk: rating backtesting	266
11.7.4	Liquidity risk methods	269
	Appendix: Historization	271
11.A.1	Granularity	273
11.A.2	Data reduction	274
11.A.3	Intraday and parallel histories	275
	Further reading	275
12	Operational Risk	277
12.1	Basic indicator and standardized approach	279
12.2	Statistical basis of the advanced measurement approach	280
12.2.1	Definitions	280
12.2.2	Self-assessment approach	281
12.2.3	Loss distribution approach	281
12.2.4	Risk indicators approach	283
12.2.5	Output	284
12.3	Operational value at risk	285
12.3.1	Static	285
12.3.2	Dynamic	286
	Further reading	288
PART IV	ANALYSIS – GOING-CONCERN VIEW	289
13	General Mechanisms	293
13.1	Market conditions and general risk factors	293
13.2	New financial production	294
13.2.1	Volume	294
13.2.2	Characteristics	296
13.2.3	Pricing	298

	Contents	xi
13.3	Behavior and counterparty	299
13.4	Cost	300
13.5	Balancing	301
13.5.1	Dynamic balancing	301
13.5.2	Static balancing and reconciliation	304
Appendix:	Aggregation	305
13.A.1	Single contract level and performance	305
13.A.2	Contract aggregation	307
14	Banks	309
14.1	Chart of accounts and portfolio structures	309
14.2	Forecasting volume and characteristics	311
14.2.1	Loans and mortgages, bond issues	312
14.2.2	Current accounts, savings and deposits	313
14.2.3	Trading and off-balance sheet	314
14.2.4	Other special accounts	316
14.2.5	Liquidity interbank and equity	316
14.3	Adding market forecast, counterparty information and behavior	318
14.3.1	Market forecast and pricing	318
14.3.2	Behavioral shifts and counterparty information	320
14.4	Analysis elements	321
14.4.1	Liquidity	321
14.4.2	Value and income	325
14.4.3	FTP	330
14.4.4	Limits, sensitivity and risk	332
15	Life Insurance	335
15.1	Chart of account	335
15.2	The life contract	337
15.2.1	Gross and net premiums	338
15.2.2	Cost	338
15.2.3	Risk premium and mortality tables	339
15.2.4	Reserve building	340
15.2.5	Surrender and surrender value	342
15.2.6	Zillmer reserves	342
15.2.7	Survival or retirement benefit	343
15.3	Forecasting new production	344
15.3.1	Volume, characteristics and pricing	344
15.3.2	Behavior	345
15.3.3	Cost	346
15.3.4	Balancing and liquidity	346
15.4	Analysis elements	347
15.4.1	Solvency II internal models	347
15.4.2	Balance sheet and P&L forecast	348
15.4.3	Economic value	349

16	Non-life Insurance	353
16.1	Chart of account	353
16.2	The non-life contract	355
16.2.1	Premium	355
16.2.2	Receivables	356
16.2.3	Claim patterns	356
16.2.4	IBNRs and reserving risk	358
16.3	The reinsurance contract	359
16.3.1	Different types of reinsurance	359
16.3.2	Selecting the ceded primary contracts	360
16.4	Forecasting new volume and characteristics	361
16.4.1	Premium written, pricing and characteristics	361
16.4.2	Claims and IBNR	362
16.4.3	Reinsurance and liquidity	363
16.4.4	Cost	364
16.5	Analysis elements	364
16.5.1	Value and income	365
16.5.2	Solvency II internal model	367
17	Nonfinancials	369
17.1	Financial and nonfinancial corporates	371
17.1.1	Cash and goods	371
17.1.2	Financial contracts in the nonfinancial world	373
17.1.3	The financial side of nonfinancials	374
17.1.4	Industries that can be modeled	375
17.1.5	Government	375
17.2	The nonfinancial model	376
17.2.1	Detail level of the meta model	376
17.2.2	Real production and cash flows	377
17.2.3	Balance sheet, OBS and P&L structure	378
17.2.4	Markets and risk factors	380
17.2.5	Relationship between risk factors, production, BS and P&L	380
17.3	Analysis elements	383
17.3.1	Static analysis	383
17.3.2	Dynamic analysis	384
17.4	Corporate valuation	387
17.4.1	Going-concern valuation	387
17.4.2	Nonoperating financial assets and market value of debt	390
17.4.3	Net operating free cash flow	391
17.4.4	Terminal and growth value	392
17.4.5	Weighted average cost of capital	394
17.4.6	Practical example of corporate valuation	396

PART V OUTLOOK AND CONCLUSIONS	397
18 The Financial Laboratory	401
18.1 Risk and performance measurements	401
18.1.1 Nonrisk ratios	401
18.1.2 Risk ratios	403
18.2 Example of an economic risk report	405
18.2.1 Income and expense	405
18.2.2 Capital	406
18.2.3 Return	408
18.2.4 Conclusion	408
18.3 Optimization	408
18.3.1 Static optimization	408
18.3.2 Dynamic optimization	410
18.4 Consistency	411
19 Towards a Unified Financial Language	413
19.1 The need for a unified financial language	413
19.1.1 Why more information?	413
19.1.2 Exemplifying the lemon problem	414
19.1.3 The power of a unified financial language	417
19.2 Structure of a unified financial language	417
19.2.1 Contracts	417
19.2.2 Risk factors	419
19.2.3 Counterparty information	419
19.2.4 Behavior parameters	420
19.2.5 Contract level information and aggregation	421
19.3 New finance, new regulation	421
Index	423

List of Figures

1.1	Cash flows projected along an investment horizon	6
1.2	Income forecast scenarios along a natural time line	7
1.3	Interfacing transaction and analytical systems	12
1.4	Interfacing transaction and analytical systems using a data warehouse	13
1.5	Using a variety of analysis specific tools leads to inconsistent results	14
1.6	Using a unified analytical engine guarantees consistency of results	16
2.1	Sensitivity of a financial institution	23
2.2	Risk factor and value distribution	24
2.3	Input and analysis elements	26
2.4	Natural time and investment horizon	33
2.5	Liquidation view	34
2.6	Going-concern view	35
2.7	Input elements and cost	39
3.1	Basic standard contract types	47
3.2	Compound standard contract types	47
3.3	Parent–child relationships of compound contracts	50
3.4	Principal amortization patterns	52
3.5	Step-up amortization pattern	53
3.6	Principal reserve pattern	54
3.7	Discount paper	62
3.8	Classical fixed bond	63
3.9	Variable bond	63
3.10	Fixed classical annuity	64
3.11	Variable annuity	64
3.12	Fixed regular amortizer with step-up	65
3.13	Hierarchy of a plain vanilla swap	65
3.14	Plain vanilla swap	66
3.15	Forward rate agreement on a discount paper	67
3.16	Hierarchy of a bond or interest rate option	67
3.17	European option on a fixed bond	68
3.18	Nonstandard contract type	69
4.1	Payoff from linear and nonlinear instruments	80
4.2	A family of spread curves classified by counterparty rating	86

xvi	List of Figures	
4.3	Simulated geometric Brownian motion paths	88
4.4	A three-step binomial tree	89
4.5	Valuation under different conditions	102
5.1	Exposures, credit enhancements and recoveries	112
5.2	Counterparty group structure	114
5.3	Counterparty with several financial contracts	115
5.4	Several counterparties related to the same financial contract	116
5.5	Credit risk influencing expected cash flows, liquidity, value and income	116
5.6	Main types of credit enhancements	117
5.7	Links between guarantees, contracts and counterparties	118
5.8	Complex links between guarantees, contracts and counterparties	119
5.9	Pattern of guarantee cash flows	119
5.10	Representation of the credit default swap process	121
5.11	Cash flows of a credit default swap	121
5.12	Structure of a sample CDO	122
5.13	Rating distribution of underlying assets and tranches of CDOs	124
5.14	Links between collaterals, contracts and CPs	125
5.15	Construction of a close-out netting agreement with a single cash event transaction e_{CE}	126
5.16	Credit line in conjunction with financial contracts and credit enhancements	128
5.17	Credit line exposures	129
5.18	A credit exposure including a credit line facility	129

Acknowledgments

We are grateful to Robert Kopociński for his diligent support in preparing the manuscript, to Daniel Imfeld who added many valuable comments to the discussion of nonfinancial industries and wrote the section on corporate valuation and to Werner Hürlimann for his valuable writing assistance in the insurance-related chapters. We would also like to thank Thomas Graf who supplied the liquidity risk related examples in Chapter 14. Many thanks go also to Mark Rudolf who spent many hours on reading and correcting an early version of the manuscript.

We are also indebted to numerous collaborators at IRIS Integrated Risk Management AG, now part of FRSGlobal, for discussions, reading preliminary versions of the manuscript and providing valuable criticism and comments. Without their help and willingness to suffer our absences this book could not have been written. We also thank the Institute of Data Analysis and Process Design at the University of Applied Sciences Winterthur for its generous support.

Finally, we are grateful to our families and friends who put up with long stretches of lost weekends and holidays while writing this book. Their encouragement, support, silent and not so silent suffering made this book possible. We look forward to spending uninterrupted weekends with them in the future.

Preface

Make everything as simple as possible but not simpler than that.
Albert Einstein

Financial analysis means different things to practitioners across a wide range of industries, disciplines, regulatory authorities and standard setting bodies. In daily practice, an accountant is likely to understand this term as bookkeeping and compliance with accounting standards. To a trader or a quantitative analyst, this term conjures up option pricing, whereas to a treasurer in a bank it can stand for liquidity gap analysis, measurement of market risks and stress testing scenarios. It could mean cost accounting and profitability analysis to a controller or a financial analyst valuing a company. A regulator or a compliance officer using this term has in mind primarily the calculation of regulatory capital charges. On the other hand, a risk officer in an insurance company is likely to think of simulating the one-year distribution of the net equity value using Monte Carlo methods.

The examples mentioned above, and there are many others, make up a vast body of complex and specialized knowledge. It is only natural that practitioners tend to concentrate on a specific topic or subject matter, driven by the necessity of generating a report, an analysis or just a set of figures. The focus on the output drives the tools, systems, methodologies and, above all, the thinking of practitioners. Hedging the gamma risk of an option portfolio, for example, is after all quite different from managing short-term liquidity risk or backtesting a VaR model for regulatory purposes.

This, however, is only superficially true. The mechanisms underlying these disparate analysis types are few, more common, and less complex than one would expect provided that everything is made as simple as possible but not simpler than that. The aim of this book is to expose these shared elements and show how they can be combined to produce the results needed for any type of financial analysis. Our focus lies on the analysis of financial analysis and not a specific analytical need. This also determines what this book is *not* about. While we discuss how market risk factors should be modeled, we cannot hope to scratch the surface of interest rate modeling. To use another example, the intricacies of IFRS accounting as such are not directly relevant to us, but the underlying mechanisms for calculating book values using these rules are.

Why should this be relevant? Given the breadth of specific knowledge required to master these topics, what is the use of analyzing analysis instead of just doing it? The main argument can be seen by looking at the expensively produced mess that characterizes financial analysis

in most banks and insurances. Incompatible systems and analysis-centered thinking combine to create cost and quality problems which become especially apparent at the top management level. Capital allocation, to use one example, relies on a combination of risk, income and value figures which are often drawn from different sources and calculated using different assumptions.

One must either invest considerable resources in the reconciliation of these figures or accept analytical results of a lower quality. Both options are becoming less tenable. Reconciling the output of many analytical systems is difficult, error prone and will become more so as analysis grows in sophistication. Regulation, which for better or worse is one of the main drivers of financial analysis, increasingly demands better quality analytical results. Due to the high costs of compliance, regulation is already perceived as a risk source in its own right.¹ In the aftermath of the subprime crises the regulatory burden and the associated compliance costs are bound to increase.

There is a better way to address these pressing issues by approaching financial analysis from a unified perspective. In this book we shall develop an analytical methodology based on well-defined inputs and delivering a small number of analytical outputs that can be used as building blocks for any type of known financial analysis. Our approach is conceptual and we discuss an abstract system or methodology for building up financial analysis. Our thinking about these issues is informed by the practical experience some of us have with implementing such a system in reality. Over a period of 20 years, there has been a reciprocal and symbiotic relationship between the conceptual thinking and its concrete implementation. It started with a doctoral thesis² which was soon implemented in banks and a few insurances corroborating the initial ideas. This is why we do not try to build this methodology consistently from first principles, a goal which is anyway not always achievable. Where a choice cannot be traced back to a well-reasoned axiom, we appeal implicitly to our experience with a concrete system implementing this methodology.

This book reflects this background. When using the terms “system” or “methodology” we primarily have in mind a conceptual view of such a system. At the same time, there is also a practical bent to our discussion since there is no value to a conceptual framework if it cannot be implemented in reality. This, however, should not be understood to mean that the target audience is made of system builders or software engineers.

Our target audience are consumers of financial analysis output – the figures and numbers – from a wide range of professional skills and hierarchical levels. The book deals with topics as disparate as IFRS accounting standards, arbitrage-free yield curve modeling using Monte Carlo techniques, option valuation, Basel II and Solvency II regulations, profitability analysis and activity-based costing to name but a few. It is, however, not a book for someone seeking specialized knowledge in any of these fields. Beyond a short introduction to these topics, we assume that the reader has the relevant knowledge or can find it elsewhere. Some help is found at the end of some chapters where a further reading section provides references to relevant literature. Not being a scholarly work, however, we abstain from providing a comprehensive bibliography; in fact we produce none. Rather, what this book attempts to do is to put different analytical concepts in their proper context and show their common underlying principles. Although we hope to satisfy the intellectual curiosity of the reader for topics outside his or

¹ Regulatory risk was top ranked in CSFI surveys of bank risks from 2005 through 2007.

² W. Brammertz, *Datengrundlage und Analyseinstrumente für das Risikomanagement eines Finanzinstitutes*, Thesis, University of Zurich, 1991.

her specialized knowledge domain, we believe that the insights gained by a unified approach to financial analysis will also contribute to the understanding of one's specific field.

Part I starts with a short and eclectic history of financial analysis leading to the chaos that characterizes the state of financial analysis today. It is followed by a condensed summary of the main themes of this book. We introduce the principles of unified analysis, and important concepts emerge, such as the natural and investment time horizons, input and analysis elements. We also draw an important distinction between static and dynamic types of analysis. Static analysis or, more accurately, *liquidation view* analysis, is based on the assumption that all current assets and liabilities can be sold at current market conditions without taking the evolution of future business into account. This restriction is removed in the dynamic, or *going-concern*, analysis where new business is also considered.

The concepts introduced in the second chapter are further developed in Part II where input elements are discussed, Part III which deals with analytical elements from a liquidation perspective, and Part IV which addresses them from a going-concern perspective. Finally, Part V demonstrates the completeness of the system, showing that all known types of financial analyses are covered and offering a solution for the current information chaos not only for individual banks and insurances but also from a global – and especially regulatory – perspective.

Having such a wide range of audience and topics, this book will be read differently by different readers:

Students of finance It is assumed that all or most topics covered, such as bookkeeping or financial engineering have already been studied in specialized classes. This book brings together for the reader all the loose threads left by those different classes. It is therefore intended for more advanced students or those with practical experience. Although the more mathematical sections can be safely skipped, the rest of the material is equally relevant.

Senior management Part I, where the main concepts are introduced, and Part V where the main conclusions are drawn, should be of interest. If it is desired to go deeper into details, parts of Chapter 3 and Chapter 4 should be read, choosing the appropriate level of depth.

Practitioners Specialists at different levels in treasury, asset and liability management, risk controlling, regulatory reporting, budgeting and planning and so on should find most parts of this book of interest. Depending on the level within the organization the relevant material may be closer to that of the student or the senior manager. According to one's background and professional focus, some chapters can be read only briefly or skipped altogether. Nevertheless, we believe that at least Parts I and V should be read carefully, as well as Part III which discusses the main building blocks of static financial analysis. In particular, Chapter 3, which discusses financial contracts in detail, should be given due attention because of the centrality of this concept within the analytical methodology. Readers dealing with liquidity management, asset and liability management, planning and budgeting in banks and insurances should find Part IV of special interest. This part could also be of general interest to other readers since dynamic analysis, to our knowledge, is not well covered in the literature.

IT professionals Although this book is not aimed at IT professionals as such, it could nevertheless be interesting to analysts and engineers who are building financial analysis software. The book reveals the underlying logical structure of a financial analysis system and provides a high level blueprint of how such a system should be built.

Financial analysts in nonfinancial industry The book addresses primarily readers with a background in the financial industry. Chapter 17, however, reaches beyond the financial into the nonfinancial sector. Admittedly the path is long and requires covering a lot of ground before getting to the nonfinancial part, but the persevering readers will be able to appreciate how similar the two sectors are from an analytical perspective. In addition to the first part of the book, Part IV should be read carefully in its entirety and in particular Chapter 17 which deals with nonfinancial entities.

Finally, we hope that this book would be of value to any reader with a general interest in finance. Finding the missing links between many subjects which are typically treated in isolation and discovering the common underlying rules of the bewildering phenomena of finance should be worthwhile and enjoyable in its own right.
